Introducing the Gaylord Utility Distribution System from Gaylord Industries

The Gaylord Distributor is a Utility Distribution System designed for today's commercial kitchen.

With the operator's needs in mind, it is designed to provide flexibility, expandability, safety, cleanliness, and convenience that no commercial kitchen should be without.

The Distributor provides all required services to the cooking equipment in an attractive, pre-engineered unit.

Optional equipment includes plumbing fixtures, pot fillers and security packages.

Available in a variety of models and styles, the Distributor is superior to a contractor-built wall, reducing contractor and trade coordination. Maintenance and servicing are a breeze.

The Distributor can be classified as an appliance, decreasing your capital costs and improving your rate of return.

Our design standard includes an extra 25% capacity for electrical and plumbing services to assure space, function, service line compatibility and expandability for your changing equipment line-ups.

Quick disconnect fittings with flexible hoses and power cords allow the equipment to be easily moved for cleaning or maintenance.

Inspection panels allow easy access to all plumbing and electrical components in both the raceway and the vertical risers.

All Gaylord Utility Distribution Systems are custom-engineered to meet your every design and budget.

– providing the quality, support and service you've come to expect - Gaylord Industries.
